Dear Hiring Manager,

I am applying for the Quality Assurance (QA) Engineer position in Nicosia, Ergodotisi Ref. No. 7009973. I applied to NETinfo earlier this year for QA and front-end openings, and this new posting is the closest match yet: applying QA standards to a digital banking platform where reliability is the product.

What I would bring to your team:

- Executing test cases and reporting bugs: two years at Nexcom Technologies doing manual and exploratory production QA in Windows environments across ongoing releases, writing defect reports with reproduction steps and system state, verifying fixes with developers, and signing off releases.
- Automated testing and regression coverage: since 2024 I own quality end to end on two shipped products, a web exam platform and a React Native mobile app, the same web-plus-mobile spread omnichannel banking has to cover, with Playwright end to end suites and API test automation running on every deploy, keeping consistent test coverage across key functional and regression areas. One backend carries JWT auth and live payments, so I already test code where money is on the line.
- Requirements to test cases: on my own products I work from the specification to the executed test and back, so reviewing business requirements and technical design documents and turning them into documented, repeatable tests is the workflow I already live in.

My B.Sc. in Software Engineering is in progress at the University of Kyrenia, expected 2027, so the completed degree the posting lists is still ahead of me; the two years of production QA and the automation running on my shipped products are what I offer against it; both products were built alongside full-time study, which is my organizational and time management evidence. My automation experience is with Playwright rather than Katalon, and my bug tracking runs through GitHub rather than Jira; in both cases the underlying concepts, the test lifecycle and the defect lifecycle, are the same and the tool is a short step I am glad to take. I also work with SQL through PostgreSQL and script in Python and TypeScript, which the posting lists as a plus.

I work in English daily; Turkish and Russian are additional working languages, useful to a platform serving banks in more than 30 countries. I am based in Cyprus, so the Nicosia office is local for me. My CV is attached, and my Is This Worth It repository, test automation included, is public on GitHub, linked above. I look forward to hearing from you.

Kind regards,

Alex Soltan
